

Chapter 1: Introduction to Computing

Computer systems consist of hardware and software components working together.
The central processing unit executes machine instructions stored in memory.

Chapter 2: Virtualization Concepts

Virtualization is the process of creating a software-based representation of physical resources.

A hypervisor or Virtual Machine Monitor separates the operating system from the physical hardware.

Type 1 hypervisors run directly on bare metal while Type 2 hypervisors run on top of a host OS.

Chapter 3: Networking Protocols

Transmission Control Protocol or TCP is a connection-oriented transport layer protocol.

TCP ensures reliable in-order data packet transmission through flow control and error checking.
